DETAILED ACTION

Response to Arguments

Applicant's arguments with respect to claims 2-3, 5-9, and 11-23 have been considered but are most in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 2, 16, and 23 are rejected under 35 U.S.C. 102(e) as being anticipated by Chuang et al (US 2005/0054296).

As to claim 2, Chuang discloses an adaptive quality control loop for a rate adaptation based on modulation and coding scheme (MCS) levels, adjusting a first channel condition threshold based on a first error detection result for a first data packet transmission between a transmitter and a receiver using a first variable size step (Par. 6-7 and 49), wherein the first channel condition threshold is based on a first modulation and coding scheme (MCS) level used in the first data packet transmission, and the first variable step size is determined using a desired MCS error rate (e.g. BLERn) for the

first MCS level (Par. 6-7, 41, 43, and 49-50), comprising: determining the first variable size step using a block or bit error rate target criterion and a first data rate associated with the first MCS level (since the block error rate target criterion is obtained for the first MCS level; par. 45).

As to claim 16, Chuang further discloses adjusting a second channel condition threshold based on a second error detection result for a second data packet transmission using a second variable size step, wherein the second channel condition threshold is associated with a second MCS level used in the second data packet transmission (Par. 6-7, 41, 43-44, and 49-50).

As to claim 23, Chuang further teaches the desired MCS error rate for the first MCS level is based on a block error rate target criterion (par. 45).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 7 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chuang et al.

As to claim 7, Chuang teaches all the subject matter claimed above, except for the desired MCS error rate is based on a bit error rate. Chuang discloses that the

desired MCS error rate is based on a block error rate. However, one of ordinary skill in the art would clearly recognize that it is well known in the art to estimate level of performance of a communication system using any of the frame, block, or bit error rate. Therefore, it would have been obvious to one of ordinary skill in the art to employ the bit error rate instead of the block error rate as the quality measurement parameter in order to estimate the level of performance of the system.

Page 4

As to claim 17, Chuang discloses all the subject matter as recited in claim 2, except for selecting a second MCS level based on an estimation of channel condition between the receiver and transmitter using a table having the adjusted first channel condition threshold. However, one of ordinary skill in the art would recognize that it is well known in the art to store different modulation coding schemes that correspond to different channel condition thresholds in a table and selecting the appropriate MCS level based on the estimate of the channel condition threshold in order to maximize throughput.

As to claims 18, Chuang inherently discloses transmitting a second data packet using the second MCS level.

As to claim 19, Chuang further discloses determining the first variable size step using the first error detection result (BLERn; Par. 41 and 50).

As to claim 20, Chuang a second variable size step using the second error detection result (BLERn; Par. 41 and 50).

Allowable Subject Matter

Claims 3, 11-15, and 21 are allowed. Claims 5-6, 8-10, and 22 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to FRESHTEH N. AGHDAM whose telephone number is (571)272-6037. The examiner can normally be reached on 9:00-5:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Chieh Fan can be reached on 571-272-3042. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
